```python
import numpy as np
from scipy import stats
revenue = np.random.normal(loc=250, scale=50, size=100)
# Sample size
n = len(revenue)
# Sample mean
mean_revenue = np.mean(revenue)
# Standard error
std_error = stats.sem(revenue)
# Confidence level
confidence = 0.95
# Confidence interval
ci = stats.t.interval(confidence, df=n-1, loc=mean_revenue, scale=std_error)
print("Sample Mean Revenue:", mean_revenue)
lower = float(ci[0])
upper = float(ci[1])
print("95% Confidence Interval:", (lower, upper))
```

```
Sample Mean Revenue: 247.89938222401273
95% Confidence Interval: (237.75968016203439, 258.03908428599107)
```
